

Weep Screed

DripWave is a complete insulation system, consisting of DripWave EPS panels and DripWave weep screed.

DripWave insulation panels and DripWave weep screed were carefully designed to work together to maximize air space behind the insulation and allow accumulated moisture to dissipate and escape while allowing air flow into the system. The unique properties of the DripWave system dramatically reduce the risk of mold and rot in one-coat stucco walls when compared with other one-coat stucco insulation methods.

There are many benefits from using DripWave weep screed:

- The elongated channels at the bottom of the weep screed provide an optimal route for water to escape and air to enter the system, regardless of the position of the DripWave panel
- Maximizes the effectiveness of DripWave insulation panels
- Made from quality galvanized metal
- Available in 10' lengths
- Provides 3/8" from the face of the DripWave insulation panel to the edge of the weep metal, in alignment with one-coat stucco application requirements
- Complies with ASTM C847 IBC and IRC
- Complies with Table 25-B of the UBC
- Easy to install

Easy to Install:

Get the benefits of an expertly designed weep metal designed to maximize the effectiveness of the DripWave system, with no additional labor or training requirement. DripWave weep screed makes installation of the DripWave system quick and easy.

- Fast Installation
- No special instructions or training is required
- Meets all requirements for one-coat stucco systems
